

Free Intervention for infants with TSC

UCLA researchers are conducting a free early intervention study that may improve social and communication skills in children with Tuberous Sclerosis Complex (TSC).

You may be eligible to participate if your child:

- Is 12-36 months of age
- Has a clinical diagnosis of Tuberous Sclerosis Complex (TSC)
- Has a parent available to attend weekly Intervention sessions at UCLA

Participants may receive:

- Developmental assessments
- Free play-based parent training
